

Wild blueberries are an integral component of Acadian and Boreal forests. At Forest Hills Farms we sustain the natural ecosystem by using gypsum to replenish calcium and use certified organic compost tea to maintain healthy soil life. For more information on Pesticide Free Production* please visit www.foresthillswildblueberries.com

Les bleuets sauvages font partie intégrante des forêts Acadiennes et Boréales. Chez nous, dans nos fermes de Forest Hills, nous maintenons l'écosystème naturel en utilisant le gypse pour rétablir le niveau de calcium, et nous utilisons du thé de compost organique certifié afin de conserver la fertilité originelle et naturelle du sol. Pour plus de renseignements sur la production sans pesticide, veuillez consulter notre site web www.foresthillswildblueberries.com

Pesticide-free wild blueberries

"We're guaranteeing the consumer that there has not been any kind of chemical pesticide or herbicide or fungicide that has been put on that field for at least one year," says George Johnson of Forest Hills Farms.

All the wild blueberries sold under the Forest Hills Farms name are grown on their own lands in the Westchester and Great Village areas on fields along the Cobequid Range.

"We don't view them as a crop that would grow on a farm," says Johnson. "We view them as a crop that would grow on the floor of the forest. And that's really different."
